The final, complete Weekly Handout for this week is available for download at the course website: (http://sciences.sdsu.edu/~leonard/astro101). For convenience, I have listed here only the changes (i.e., additions, deletions, or changes) that were made to the version of the handout contained in your Course Reader. Rather than printing out the entire handout, you may wish to simply write these changes in to the Reader version of this Weekly Assignment.

Changes to the Week #8 Handout printed in the Course Reader:

• The introduction to the reading assignment has been slightly modified, to better reflect the actual chapters that are being assigned. It now says:

This week we finish our study of light, and continue our investigation of the stars, answering a fundamental questions about them: What are they made of (in detail)?

Note that the reading material for this week comes from Chapters 4, 6, 8 and 12. For chapter 4, we have now completed the entire chapter. For chapters 6, 8, and 12, we’ll only be covering parts of them. Note that there is no formal reading assignment from Chapter 5, on astronomical telescopes; for this chapter, you are ONLY responsible for the material that was explicitly presented in class, and is contained on the Powerpoint slide about Astronomical Instruments (slide 194 in your Reader); you do not need to read the chapter (although, of course, you are certainly welcome to!).
