How to use star chart:

• Locate the Big Dipper. (Note: before ~7:30, this may be tough, since the entire asterism is not above the Northern horizon.)

• Locate the “pointer stars” (the 2 at the end of the bucket).

• Connect the two pointer stars in the direction the open bucket is facing, and continue the line until it hits the first reasonably bright star, Polaris, the North star.

• Face Polaris, and turn star chart so that “North” is down.

• Look straight up towards the zenith holding star chart overhead; the stars in the sky should now match the stars on the chart!
